

2009 Summer Test

Kistler Supports Vehicle Testing by Automobile Companies

An international service team set out on Europe's highest road on the Spanish mountain of *Pico del Veleta* to give a week of expert yet straightforward support revolving around sensor mounting, software installation, measurement configuration and advice on general measurement issues.

The great difference in altitude and temperature makes this region in the Sierra Nevada practically ideal for vehicle testing, particularly for configuration of the engine control unit (ECU). A large number of carmakers were therefore delighted with the active support of the Kistler team.

Kistler had brought the new KiBox® To Go combustion analysis system, which is designed specifically for mobile in-vehicle use, onto the market just a few months beforehand. This system, which measures all of the key parameters extremely accurately in real time, could now be demonstrated live in the vehicle test.
