Surface strain sensor

for indirect measurement of process forces

This robust strain sensor is particularly suitable for measuring dynamic and quasistatic forces on stationary or moving machine parts. For this purpose it uses force-proportional strain on machine or structural surfaces for indirect force measurement.

- Wide range for tension and compression forces
- High sensitivity allows accurate measurement of minute strains
- Overload-proof design
- Robust industrial construction (IP67)
- Easy mounting with just one screw

Description

The strain of the basic material acts via the two contact surfaces on the sensor as a change in distance. The sensor housing serves as an elastic transmission element that converts this change into a force. The piezoelectric elements in shear generate an electric charge $Q$ [pC] proportional to the force.

The particular advantages of piezotechnology over the familiar foil strain gage technology are high sensitivity, substantial overload resistance, virtually unlimited service life and high load cycle stability.

The measurement signal can be processed as a relative value. For absolute value measurements (e.g. in N or kN) the strain sensor must be calibrated against an appropriate reference.

The design of the sensor and its stainless steel housing allow it to be used in industrial environments. The Type 9237B20 e.g. with cable Type 1915A... provides an IP67 protection level for use in wet and dirty situations.

The integral KIAG 10-32 neg. connector accommodates a broad selection of connecting cables (see notes on accessories).

Applications

The sensor Type 9237B... can be used for monitoring all types of machinery with a gap frame, such as mechanical presses and automatic assembly machines, and its ease of mounting makes it ideal for retrofitting. Application sectors include:

- Machine monitoring, such as protecting mechanical presses against overload
- Quality assurance in production runs for joining process such as wobble riveting, clinching and resistance spot welding
- Monitoring machine tools, such as prompt detection of tool breakage or tool collision

Surface strain sensor – for indirect measurement of process forces Type 9237B...

Dimensions

Fig. 1: Type 9237B10

Mounting

- Machine the surface at the measuring point (N7; Ra 1.6 microns) and tap the M6 female thread (see Figure 3).
- Align the sensor on the structure of the machine. Position the measuring axis so as to record the maximum strain (Figure 4).
- The sensor is secured with a single screw with pre-greased thread and head bearing surface. Preload this screw with a torque of 14 N·m (Figure 5).
- The cable run close to the sensor should be as free from tension or compression as possible. Transmission of cable movements or vibration to the sensor must be avoided.

Typical application

Fig. 6: Indirect measurement of electrode clamping force on a spot welding machine with strain sensor Type 9237B10

Included accessories

- 6-point socket head cap screw, M6x30
  Type/Art. No.: 6.120.033

Optional accessories

- Various highly insulated connecting cables with KIAG 10-32 pos. connector, such as 1983A...
- High-temperature connecting cable in sealed protective hose 1915A1
- Sturdy connecting cable KIAG 10-32 pos. int., BNC pos., IP67 (Lmin=1m / Lmax=10m) 1900A21A125P
