MicroDyn

Multicomponent dynamometer up to 500 N, cover plate 30x30 mm

Multicomponent dynamometer for measuring the three orthogonal components of a force and the torque \( M_z \). The very low threshold and the high sensitivity allow even the smallest forces to be measured. With a natural frequency higher than 15 kHz in all three axes, highly dynamic forces can be recorded with extremely high accuracy.

- Very compact design
- Patented sensor arrangement
- High sensitivity and natural frequency
- Reduced influence of temperature through compensation
- Cover plate made of hard-anodized lightweight material
- For cutting force measurements in micro-machining
- For general multicomponent force measurements

Description
The dynamometer consists of four, 3-component force sensors which are mounted under high pretension between the cover plate and the four lateral assembly elements. Thanks to this special mounting of the sensors, temperature influences can be partially compensated for and the influence of the temperature thereby minimized. The force measurement of the sensors is based on the piezoelectric principle. The application of a force causes the crystal rings installed in the sensor (one crystal ring for each of the force components that is to be measured) to release a charge that is proportional to this force. The charge signals of the four installed force sensors are internally connected and output by a 9-pin flange socket. In addition to the direct measurement of the three force components, an indirect measurement of the torque \( M_z \) is possible through an appropriate calculation. The sensors are mounted ground-isolated (dry state). Ground-loop problems can thereby be largely avoided.

The dynamometer is corrosion resistant and protected against the penetration of cooling lubricant. Together with the 8-pin connecting cable Type 1677A5, Type 1677AQ02 or Type 1679A5, the dynamometer is protected against the penetration of dust and liquids according to degree of protection IP67.

Application examples
- Multicomponent force measurement of extremely small and highly dynamic forces
- Cutting force measurement in
  - precision machining
  - micromachining
  - ultra-high precision machining of brittle materials

Mounting
The dynamometer can be mounted with eight M4 screws to any face-ground, clean mounting surface, such as on a machine tool table. Mounting on a magnetic plate is made possible by means of a supplied steel base plate. It must be noted that uneven contact surfaces may cause internal distortions, which could place additional heavy stresses on the individual links and increase crosstalk.

M4 tapped blind holes, Ø3.4 through holes as well as 4.5H7 fittings are provided in the cover plate for mounting the force-introducing components such as workpieces or work holders. The contact surfaces of the force-introducing parts must be surface ground to achieve good mechanical coupling to the cover plate.

Measuring signal processing
The sensor outputs the charges of the individual sensors via a 9-pin connector with the following pin assignment.

To convert the charges output by the sensor to a voltage that can be used by data acquisition devices, multi-channel charge amplifiers are used (e.g., Type 5080A or Type 5167A81). The measurement value of the individual channels is proportional to the applied force.

Data acquisition
If a high-end laboratory charge amplifier Type 5080A is used, Kistler offers a universal and simple to operate package with DAQ system Type 5697A1 consisting of hardware for data acquisition as well as the DynoWare software. For details, see data sheet doc. no. 5697A_000-745.

If charge amplifier Type 5167A81 is used, this is available as model Type 5167A81DK with digitalization and the Dynoware software in the package. This eliminates the need for other external data acquisition, thereby reducing wiring work considerably.

Data analysis
To calculate the three orthogonal force components and the torque Mz from the output signals, the following equations are used:

\[
\begin{align*}
F_x &= F_{x1} + F_{x2} + F_{x3} = F_{x1}' + F_{x2}' + F_{x3}' - F_{x3}' \\
F_y &= F_{y2} + F_{y1} + F_{y4} = F_{y2}' + F_{y1}' + F_{y4}' - F_{y4}' \\
F_z &= F_{z1} + F_{z2} + F_{z3} + F_{z4} = F_{z1}' + F_{z2}' + F_{z3}' + F_{z4}' - F_{z4}' \\
M_z &= (F_{x1} - F_{y2} + F_{x3} - F_{y4}) \cdot a \cdot k_{Mz} = (F_{x1}' - F_{y2}' - F_{x3}' - F_{y4}') \cdot a \cdot k_{Mz}
\end{align*}
\]

When using the Dynoware software, these calculations rules are stored in a template, eliminating the need for additional programming when setting up the system and thereby avoiding errors.
